                 The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where: F1 = an FC domain; X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-(L2)d-P2, -(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently 0 or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. NNAs, vectors and host cells from the present invention can be used for producing pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; Minhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase; asthma; vascular endothelial growth factor; matrix metalloproteinase;
                                                                                                                                                                                                                                                                                   Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            23-OCT-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        C cyrostatic, antirhumatic, antilarthritic, antidiabetic, ophthalmological, and antivibulatic, antidiabetic, operation, and construction and consumprotective activities. (I) can be used as a therapeutic or CC prophylactic agent as well as for screening purposes. (I) is useful for diagnosing diseases characterised by dysfunction of their associated protein of interest, for identifying normal or abnormal proteins of construction of interest, as a part of diagnostic kit to detect the presence of their construction of interest, as a part of diagnostic kit to detect the presence of their construction of interest, and autoimmune diseases, tumour growth, cancer, construction arthritis, diabetic retinopathy, obesity, sleep disorders, confertility, and neurological degenerative diseases. (I), comprising EPO-construction of their such as anaemia. The TPO-mimetic comprising comments of the construction of the construction of the present antion acid and nucleic and aplastic anaemia, metastatic cumour which result in thrombocytopaenia, systemic lupus erythematosus, conference, and Fanconi's syndrome. ABB72403 to ABB73426 and ABL35695 to ABL35777 represent amino acid and nucleic acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel TALL-1-binding polypeptide comprising defined sequence in the specification. The composition is useful in modulating the activity of TALL-1, and in treating, preventing, ameliorating, diagnosing or prognosing a B-cell-mediated autoimmune disease (e.g. systemic lupus erythematosus) or B-cell-mediated cancer lymphoma. The composition may also be used in treating inflammations (e.g. rheumatoid arthritis), acute pancreatitis, Alaheimer's disease, asthma, atherosclerosis, cachexia, cirrhosis, diabetes, glomerulonephritis, Hashimoto's thyroiditis, ischaemic injury, multiple myeloma, multiple sclerosis, osteoporosis, parkinson's disease, psoria and vasculitis. Disorders may be treated with the novel composition us gene therapy. This sequence represents a TALL-1 inhibitory protein of

The composition is useful in modulating the activity of TALL-1, and in treating, preventing, ameliorating, diagnosing or prognosing a B-cell-mediated autoimmune disease (e.g. systemic lupus erythematosus) or B-cell-mediated cancer or lymphoma. The composition may also be used in treating inflammations (e.g. rheumatoid arthritis), acute pancreatitis, Alzheimer's disease, asthma, atherosclerosis, cachexia, cirrhosis, diabetes, glomerulonephritis, Hashimoto's thyroiditis, ischaemic injury, multiple myeloma, multiple sclerosis, osteoporosis, Parkinson's disease, psoriasis and vasculitis. Disorders may be treated with the novel composition using gene therapy. This sequence represents a TALL-1 inhibitory protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      11-MAY-2001; 2001US-0290196P

New TALL-1-binding polypeptide, useful for modulating the activity TALL-1 and in treating, preventing or diagnosing a B-cell-mediated autoimmune diseases, cancers or lymphomas.

68; 236pp; English.

The invention relates to a novel TALL-1-binding polypeptide comprising a defined sequence in the specification. The composition is useful in modulating the activity of TALL-1, and in treating, preventing, ameliorating, diagnosing or prognosing a B-cell-mediated autoimmune disease (e.g. systemic lupus erythematosus) or B-cell-mediated cancer or lymphoma. The composition may also be used in treating inflammations (e.g. rheumatoid arthritis), acute pancreatitis, Alzheimer's disease, asthma, atherosclerosis, cachexia, cirrhosis, diabetes, glomerulonephritis, Hashimoto's thyroiditis, lischaemic injury, multiple myeloma, multiple sclerosis, osteoporosis, Parkinson's disease, psoriasis and vasculitis. Disorders may be treated with the novel composition using gene therapy. This sequence represents a TALL-1 inhibitory protein of the

                                                                                                                                                                                                                                                                                                                                                                            CC The present sequence is the protein sequence of AGP3 peptibody, an AGP3 CC trandem dimer peptide-Fc fusion. A claimed method for treating an CC inflammatory or an autoimmune condition comprises administering at least CC one of an AGP3 inhibitor, a BAFFR inhibitor and a TACI inhibitor CC comprising the present sequence, and at least one of a B7 inhibitor and a CC CD28 inhibitor. Alternatively, the AGP3 inhibitor or CC TACI inhibitor is used in combination with an interleukin-1 inhibitor or CC such as KLM2 ADD76791 or a tumour necrosis factor-alpha inhibitor such as CC STMFR-1 ADD76792. The AGP3 inhibitor prevents binding of AGP3 to BAFFR CC and TACI. The inflammatory or autoimmune condition is selected from CC rheumatoid arthritis, psoriatic arthritis, systemic lupus erythematosus, CC graft rejection, psoriasis and inflammatory bowel disease. In examples CC graft rejection, psoriasis and inflammatory bowel disease. In examples CC graft rejection, psoriasis and inflammatory bowel disease. In examples CC graft rejection, psoriasis and inflammatory bowel disease. The camples CC graft rejection psoriasis and inflammatory bowel disease. The camples CC graft rejection compared to KIN2 or STMFR-1 and AGP3 peptibody reduced collagen-induced arthritis in susceptible B10.RIII mice for an CC extended period compared to KIN2 alone.
                                                                                                                                                                                                                                                                            Query Match

                                        The present invention describes a vehicle-peptide molecule (I) or its multimers. (I) can have antiinflammatory, antitumour, immunosuppressive, cytostatic, antiirheumatic, antiarthritic, antiidabetic, ophthalmological antianaemic, anorectic, antiinfertiilty, haemostatic, dermatological and neuroprotective activities. (I) can be used as a therapeutic or prophylactic agent as well as for screening purposes. (I) is useful for diagnosing diseases characterised by dysfunction of their associated protein of interest, for identifying normal or abnormal proteins of interest, as a part of diagnostic kit to detect the presence of their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modified peptide; mimetic; Fc domain; fusion; immunoglobulin G; IgG; EPO; erythropoietin; TPO; tumour necrosis factor alpha inhibitor; TNF-alpha inhibitor; interleukin 1 antagonist; IL-1 antagonist; TMP; TPO mimetic peptide; EMP; VEGF antagonist; MMP inhibitor; antiinflammatory; antitumour; immunosuppressive; cytostatic; antirheumatic; antiarthritic; antiidabetic; ophthalmological; antianaemic; anorectic; antiinfertility; haemostatic; dermatological; neuroprotective; inflammatory disease; autoimmune disease; tumour growth; cancer; rheumatoid arthritis; diabetic retinopathy; infertility; obesity; sleep disorder; neurological degenerative disease; anaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                               Novel vehicle-peptide molecule or its multimers useful for treating inflammatory and autoimmune diseases, cancer, rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders and infertility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              05-APR-2002

Additionally, (I) is useful for treating inflammatory and autoimmune diseases, tumour growth, cancer rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders, infertility, and neurological degenerative diseases. (I), comprising EPC mimetic compounds are useful for treating disorders characterised by low red blood cell levels such as anaemia. The TPO-mimetic comprising compounds are useful for treating conditions that involve an existing megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency, such as thrombocytopaenia, aplastic anaemia, metastatic tumour which result in thrombocytopaenia, systemic lupus erythematosus, and Fanconi's syndrome. ABB72403 to ABB73426 and ABL35695 to ABL35777 represent amino acid and nucleic acid sequences used in the

Ig gamma chain C region - chimpanzee
C;Species: Pan trogLodytes (chimpanzee)
C;Date: 23-Nov-1991 #sequence_revision 23-Nov-
C;Accession: PT0207
R;Ehrlich, P.H.; Moustafa, Z.A.; Oestberg, L.
Mol. Immunol. 28, 319-322, 1991
A;Title: Nucleotide sequence of chimpanzee Fc
A;Reference number: PT0207; MUID:91287716; PM
A;Accession: PT0207
A;Molecule type: mRNA
A;Residues: 1-234 CEHR>
                                A;Map position: 14932.33-14932.33

Ig gamma 2a chain constant region - pig (fragment)
C.Species: Sus scrofa domestica (domestic pig)
C.Date: 21-Feb-1997 #sequence_revision 21-Feb-1997 #to
C.Accession: 147159
R.Kacskovics, I.; Sun, J.; Butler, J.E.
J. Immunol. 153, 3565-3573, 1994
A.Title: Five putative subclasses of swine IgG identii
A.Reference number: I47158; MUID:95015845; PMID:793057
A.Accession: I47159
A.Status: preliminary; translated from GB/EMBL/DDBJ
A.Molecule type: mRNA
A.Ressidues: 1-328 <KAC>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ig gamma 2b chain constant region - pig (fragm C;Species: Sus scrofa domestica (domestic pig) C;Date: 21-Feb-1997 #sequence_revision 21-Feb-C;Accession: I47160

A;Contents: annotation; disulfide bonds
A;Note: Cys-16 is involved in a heavy-light chain bond
A;Note: Cys-16; Cys-107, and Cys-10 form inter-heavy chain bonds
A;Note: Cys-105, Cys-107, and Cys-110 form inter-heavy chain bonds
C;Comment: This chain was isolated from pooled serum of strain 13 inbred guinea pigs.
C;Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kap hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into la C;Superfamily: immunoglobulin cregion; immunoglobulin homology
